PREFACE

Praise be to Allah SWT, the Almighty and Most Merciful, who has granted His blessings and guidance so that the writer was able to complete this paper entitled "*Warehouse Database Using Mysql Workbench*." This work is part of an academic task and is intended to provide additional knowledge regarding Implementation Database.

The writer would like to express sincere gratitude to Mr. Riza, as well as all lecturers who have provided support and guidance during the preparation of this paper. Appreciation is also extended to friends and colleagues at CCIT FTUI, who contributed encouragement, assistance, and valuable discussions throughout this work.

The writer realizes that this paper is still far from perfect, and therefore welcomes suggestions and constructive feedback from readers for improvement in the future. Hopefully, this paper can bring benefits to both the writer and the readers in the ongoing journey of learning.

ACKNOWLEDGEMENT

Authors would like to praise to Allah SWT, the Most Merciful and the Most Gracious, because with His blessings and guidance the authors were able to finish this project entitled “Warehouse Database”. The authors also would like to express their deepest gratitude to Mr. Muhamad Riza Iqbal as Lecturer who has given valuable guidance, advice, and constructive feedback during the preparation of this project.

The authors also thank the management of CEP CCIT for providing academic facilities and support throughout the learning process. Special appreciation is extended to our friends and colleagues who have encouraged us, shared knowledge, and provided motivation to complete this report. Without their support, this work would not have been finished as expected.

The authors realize that this paper is still far from perfect, and there may be many weaknesses and mistakes in the writing and analysis. Therefore, constructive suggestions and criticism from readers are highly welcomed for the improvement of this report in the future. Hopefully, this project can give useful insight both to the authors and to the readers.

BACKGROUND

A warehouse plays a crucial role in modern logistics, not only as a storage facility but also as a center for sorting, organizing and distributing goods. In this project, the warehouse being analyzed functions as a central hub that receives products from various sellers before they are sorted and delivered to four distribution areas: West Depok, East Depok, North Depok and South Depok.

This warehouse handles two main categories of goods: electrical and non-electrical items. Each category has its own characteristics and storage requirements. Electrical goods, for example, need a designated area to ensure safety, maintain proper temperature and prevent risks such as damage or short circuits. Meanwhile, non-electrical items can be stored in general warehouse sections, although they still require systematic organization based on type, size, or delivery destination. These differences in handling and storage create additional complexity, making a well-structured and reliable database system essential.

With a continuous flow of incoming and outgoing goods, the warehouse requires a database capable of recording detailed information about incoming trucks, outgoing shipments, received items, storage locations, and staff involvement. The design and implementation of the “Warehouse Database” aim to organize and document every workflow starting from receiving goods from sellers, sorting and placing them in the appropriate storage areas, until they are distributed to the four Depok regions. This system is expected to improve efficiency, accuracy, safety, and traceability throughout the warehouse operations.

SYSTEM ANALYSIS

When a delivery truck arrives at the warehouse, it carries a combination of electrical and non-electrical goods. These items are first received and checked before being handed over to the internal staff for sorting. The internal staff is responsible for categorizing and placing the goods into one of four designated areas, each representing a specific distribution destination.

After the sorting process is completed, the external staff takes over. Their task is to transfer the sorted goods from the storage areas to the outbound trucks assigned to the four destination zones. Through this workflow, the system ensures that every item is properly processed, tracked and delivered to the correct region with minimal errors.

ERD DESIGN

Entity Relationship Diagram, also known as ERD, ER Diagram or ER model, is a type of structural diagram for use in database design. And here is the ERD of the Warehouse database.

NORMALIZATION TABLE

In ERD there is normalization where each element depends on the primary key to connect them between each table. The following picture are Normalization Tables from our Warehouse System.
